

Basic Course Laparoscopic Surgery

The basic course provides an introduction to general aspects of laparoscopic surgery. In the foreground is the laparoscopic cholecystectomy, whereby an overview of the further spectrum of laparoscopic operations, eg. B. laparoscopic appendectomy, endoscopic herniotomy is given. The theoretical content will be supplemented in the workshop by practical exercises. Participants perform laparoscopic cholecystectomies and appendectomies on preparations in Pelvic and Perfusion trainers and practice laparoscopic suturing and knotting techniques. Additional basic exercises at the virtual simulation trainer make it possible to give participants measurable feedback on their learning curve.
